They're Back – Compact Intelligent Message Displays Reintroduced

Yes, they're back. The popular DAA 144-120 series intelligent message displays have been reintroduced by Metrix Electronics Ltd* after being re-engineered to use currently available vacuum fluorescent displays.

Featuring a single line of clear 20 alphanumeric characters, they are housed in an ultra compact enclosure with a compact 144 x 36mm bezel size.

B-versions in the series store up to 255 message texts, which can be triggered by a PLC via Binary, BCD or Serial inputs. Variable data can also be inserted. A real-time clock and multiple character sets are available, including Cyrillic. Selected texts can be printed, through its serial interface, to an IPP 144-40 panel printer or **A-version** 'slave' display.

The family also includes two line, 40-character, DAA 288-240 versions in a larger housing having a 288 x 72mm bezel size.
