Contact Position Indicators

The GMW* **ST series** contact position indicators are designed to show the operation of changeover switches or relays on remote switchboard or mimic display panels. When in use, a rotating white disk has black line to indicate the three possible switch actuation modes: OFF, ON or ERROR (no connection).

This enlarged range is available from Metrix Electronics Ltd in a choice of sizes with 25mm and 32mm round, or 25mm square bezels. All models only require a 20.5mm diameter panel mounting hole. Versions are available for DC or AC operating voltages from 24V to 230V with push-on tab connectors. Full contact protection boots are available as accessories.
